	UGM-109E Tomahawk Block IV TACTOM; inertial, TERCOM and GPS-aided navigation with DSMAC to 1,600+ km (865+ n miles) at Mach 0.7; warhead (WDU-36/B) 313 kg.
Torpedoes:	4—533 mm Mk 68 bow tubes. Raytheon Mk 48 Mod 5/6 or Mk 48 Mod 7AT CBASS; wire-guided (option); active/passive homing to 50 km (27 n miles)/38 km (20.5 n miles) at 40/55 kt; thermal; warhead 300 kg; depth to 1,200 m (3,940 ft).
Physical countermeasures:	**Decoys:** 8 launchers for Countermeasures Set Acoustic (CSA) and internal (reloadable) anti-torpedo decoy system.
Electronic countermeasures:	**ESM:** BLQ-10; radar and comms intercept and analysis.
Radars:	**Surface search/navigation/fire control:** BPS 15J; I/J-band.
Sonars:	BQQ-10 suite; passive search (spherical array). TB-23/29; passive towed array (thin line). TB-16; passive towed array (fat line). ARCI.
Combat data systems:	BYG-1 Combat Control System.
Weapon control systems:	BYG-1.

Programmes

Programmes:	The 1994 nuclear posture review recommended a 14-strong SSBN force and that the remaining four Ohio class be converted to SSGN role. The SSGN would include land attack, special forces insertion and support and ISR roles. Conversion contract with General Dynamics Electric Boat in October 2002. *Ohio* started mid-life refuelling on 15 November 2002 and conversion work at Puget Sound Naval Shipyard on 19 November 2003. She completed conversion in December 2005. *Florida* started mid-life refuelling in August 2003 and conversion work at Norfolk Naval Shipyard in April 2004. It completed conversion in April 2006. *Michigan* started refuelling in March 2004 and conversion work (at Puget Sound) in October 2004. It completed conversion in November 2006. *Georgia* started refuelling in March 2005 and started conversion at Norfolk in October 2005. It completed conversion in November 2007.
Structure:	The size of the Ohio-class submarine was dictated primarily by the 24 missile tubes and the reactor plant to drive the ship. The reactor has a nuclear core life

	of about 20 years. Diving depth is 244 m *(800 ft)*. Type 8J periscope and Integrated Submarine Imaging System (ISIS). Mk 19 Air Turbine Pump for torpedo discharge.
Modernisation:	Conversion work allows an SSGN to carry up to 154 Tomahawk or Tactical Tomahawk missiles by enabling seven cruise missiles to be fired from each of 22 of the current 24 Trident missile tubes. Some of these tubes are interchangeable with Special Forces stowage canisters. The remaining two tubes are permanently configured for wet/dry launch of up to 66 special operations forces. The combat system is also to be upgraded and future payloads are being developed to augment the baseline configuration. The sonar suite has been upgraded to BQQ-10 (V4) ARC-I system standard, which improves legacy sonars by the use of system architecture and improved data processing. The ARC-I programme facilitates progressive sonar processing hardware and software upgrades.
Operational:	*Georgia* played the part of an SSGN during Exercise 'Silent Hammer' in 2004. This tested procedures for strikes against time-critical targets and use of special operations forces. An onboard battle-centre tested communications and networking required to support them. All boats returned to the fleet by 2007. *Florida* launched more than 90 Tomahawk missiles during international operations in Libya in March 2011. *Ohio* and *Michigan* are based at Bangor, WA, and *Florida* and *Georgia* are based at King's Bay, GA. *Michigan* became first US Navy submarine with female enlisted crew in 2016.
